Is it polycystic ovary syndrome causing the hyperstimulation again?

We have been very interested in this very rare entity of spontaneous ovarian hyperstimulation. In the light of our knowledge from the controlled ovarian hyperstimulation cycles, polycystic ovary syndrome is a risk factor for hyperstimulation syndrome and may be a risk factor for spontaneous hyperstimulation also. This possibility is supported with 1 of the other 2 cases in the literature of the published article. The currently described patient had regular menses, but we would like to know if this patient had had polycystic-like ovaries or other hyperandrogenism-related clinical pathologic conditions before or after her pregnancy.
